## WHAT IS CLAIMED IS:

2 1. A method for detecting objects and ranging used by vehicle backing system,

. (\*)

- 3 which includes:
- 4 presetting "n" number of threshold values in memory, each based on a specific
- 5 distance;

1

- 6 sampling "n" times on an echoed signal;
- 7 saving "n" number of sampled signal values in memory;
- 8 comparing each sampled signal with the respective threshold value, if the value
- 9 of the newly sampled data is greater, that means an object is present in the detection
- range, so distance computation can be initiated; and the current sample value is further
- 11 compared with the control data (i.e. previous sample value); if the current sample value
- is not equal to the previous sample value, then the current sample data is saved to replace
- the previous control data; but if two are equal or close to each other, the current sample
- value is only used for distance computation without updating the control data.
- 2. A method for detecting objects and ranging used by vehicle backing system as
- claimed in claim 1, whereby when any sampled signal is notably above the
- 17 corresponding threshold value, that means an object is present, distance computation can
- be initiated, since the threshold value represents a predetermined distance value.
- 3. A method for detecting objects and ranging used by vehicle backing system as
- claimed in claim 1, whereby when one of the sampled data is notably above the previous
- 21 sample, that means an object is present, distance computation can be initiated.
- 4. An apparatus for detecting objects and ranging used by vehicle backing
- 23 system as claimed in claim 2, wherein the sensor array is made up of one or more signal
- 24 sensors or transceivers.

5. An apparatus for detecting objects and ranging used by vehicle backing 1 2 system as claimed in claim 3, wherein the sensor array comprises one or more signal 3 sensors or transceivers.

- 6. A method for detecting objects and ranging used by vehicle backing system as claimed in claim 4, whereby, if one or more object is detected, the sensor recording the smallest distance value is regarded as the actual distance from the nearest object.
- 7. A method for detecting objects and ranging used by vehicle backing system as 7 claimed in claim 5, whereby, if one or more object is detected, the alarm warning is 8 9 issued with a frequency set to correspond to the relative distance.
- 8. A method for detecting objects and ranging used by vehicle backing system as claimed in claim 6, wherein, if an object is detected, the alarm warning is issued with a 12. frequency set to correspond to the relative distance.
  - 9. An apparatus for object detection and ranging used by vehicle backing system, which includes:
  - a processor, which is connected to an alarm and a memory device, and is used for detecting objects and issuing a warning when there is obstruction;
- a channel selector, which is controlled by the processor and is used to select the 17 18 active sensor;
  - multiple power boosters, which are connected between the channel selector and the sensors in the sensor array for controlling the signal transmission by the above sensors; and
    - an A/D converter, which is connected between the channel selector and the processor, and is used to convert the received signal to a digital format for computation of relative distance;

1	whereby, the processor through the channel selector governs the sequence of
2	transmission of a ranging signal by one of the sensors in accordance with a given
3	sequence, and later the reception of echoed signals, by the same sequence, which are
4	then converted by the A/D converter to a digital format for computation of relative
5	distance.

- 10. An apparatus for object detection and ranging used by vehicle backing system as claimed in claim 9, wherein the A/D converter is connected through a signal amplifier to the channel selector, and then further connected to the sensor array; whereby the signal received from the sensor array is amplified and passed to the comparator in the A/D converter circuit.
- 11. An apparatus for object detection and ranging used by vehicle backing system as claimed in claim 9, wherein a latch is used to connect the I/O pins of the processor and the address pins of the memory device.
- 12. An apparatus for object detection and ranging used by vehicle backing system as claimed in claim 9, wherein the A/D converter includes:
- a voltage doubling circuit whose inputs are respectively connected to the processor; and
- a comparator where one input is connected to the output of the signal amplifier, the other input is connected to the output of the voltage doubling circuit, and the output is connected to the processor.
- 13. An apparatus for object detection and ranging used by vehicle backing system as claimed in claim 12, wherein the signal amplifier is formed from multiple cascaded operational amplifiers.
  - 14. An apparatus for object detection and ranging used by vehicle backing

- system as claimed in claim 13, wherein the output from the first-stage operational
- 2 amplifier in the signal amplification circuit is connected in series with a noise shielding
- 3 circuit.
- 4 15. An apparatus for object detection and ranging used by vehicle backing
- 5 system as claimed in claim 9, wherein the alarm is implemented by a buzzer.
